## Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the applications:

## **Listing of Claims:**

1. (Currently Amended) A method for exposing pre-diffused IP blocks in a semiconductor device for prototyping based on hardware emulation, comprising:

connecting interface pins of at least two pre-diffused IP blocks in a semiconductor device to input ports of a multiplexer;

connecting an output port of said multiplexer to an I/O pin of said semiconductor device;

providing an address to said multiplexer through a configuration pin of said semiconductor device to decide which of said interface pins is actually connected to said I/O pin; and

connecting said I/O pin to a reusable field programmable device so that an <u>pre-diffused</u> IP block having said interface pin is selected for prototyping.

- 2. (Original) The method of claim 1, wherein said multiplexer has two input ports.
- 3. (Original) The method of claim 1, wherein said multiplexer has at least three input ports.
- 4. (Original) The method of claim 1, wherein said reusable field programmable device is a field programmable gate array.
- 5. (Original) The method of claim 1, wherein said reusable field

Appl. No. 10/603,905 Reply to Office Action of March 20, 2007

programmable device is a programmable logic device.

6. (Currently Amended) An apparatus for exposing pre-diffused IP blocks in a semiconductor device for prototyping based on hardware emulation, comprising:

a multiplexer;

means for connecting interface pins of at least two pre-diffused IP blocks in a semiconductor device to input ports of a multiplexer;

means for connecting an output port of said multiplexer to an I/O pin of said semiconductor device;

means for providing an address to said multiplexer through a configuration pin of said semiconductor device to decide which of said interface pins is actually connected to said I/O pin; and

means for connecting said I/O pin to a reusable field programmable device so that an <u>pre-diffused</u> IP block having said interface pin is selected for prototyping.

- 7. (Original) The apparatus of claim 6, wherein said multiplexer has two input ports.
- 8. (Original) The apparatus of claim 6, wherein said multiplexer has at least three input ports.
- 9. (Original) The apparatus of claim 6, wherein said reusable field programmable device is a field programmable gate array.
- 10. (Original) The apparatus of claim 6, wherein said reusable field programmable device is a programmable logic device.

11. (Original) An apparatus for exposing pre-diffused IP blocks in a semiconductor device for prototyping based on hardware emulation, comprising:

pre-diffused IP blocks in a semiconductor device,

I/O pins of said semiconductor device for providing input and output to said semiconductor device;

a multiplexer communicatively coupled to interface pins of said pre-diffused IP blocks and one of said I/O pins;

a configuration pin of said semiconductor device for providing an address to said multiplexer to decide which of said interface pins is connected to said I/O pin.

- 12. (Original) The apparatus of claim 11, wherein said semiconductor device is based on a slice.
- 13. (Original) The apparatus of claim 11, wherein said multiplexer has two input ports.
- 14. (Original) The apparatus of claim 11, wherein said multiplexer has at least three input ports.
- 15. (Original) The apparatus of claim 11, further comprising a reusable field programmable device connected to said I/O pin for prototyping.
- 16. (Original) The apparatus of claim 15, wherein said reusable field programmable device is a field programmable gate array.
- 17. (Original) The apparatus of claim 15, wherein said reusable field programmable device is a programmable logic device.
